Office Action Summary

Application No.

09/527,691

Applicant(s)

YAMAGUCHI, MASAHIKO

Examiner

Sara Bowes

Art Unit

2136

-- Th MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on 2/6/04.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-18 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-18 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Status of Claims

Claims 1-18 are pending in this office action, claims 1, 7, 8, and 14-18 are newly amended.

Applicant's arguments filed on February 6, 2004, have been fully considered but they are not persuasive.

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 17 and 18 are rejected under 35 U.S.C. 101 because nonstatutory subject matter is claimed. A data processing program is nonstatutory subject matter as a result is unpatentable. Refer to MPEP 2106.

Rejections

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 1-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 5,805,700 to Nardone et al. in view of U.S. Patent No. 5,412,730 to Jones.

Referring to claim 1, Nardone et al. teach a data processing apparatus comprising:

- input means for inputting data to be transmitted [see Figure 5, (CVD+), 16];
- extracting means for extracting a particular portion of the data input from the input means [column 4, lines 49-51];
- encrypting means for encrypting the particular portion extracted by the extracting means [see Figure 5, Encryption Module, 12'];
- combining means for combining the particular portion encrypted by the encrypting means with a remaining portion not extracted by the extracting means [figure 8]; and

Nardone et al. do not teach a transmitting means for transmitting data combined by the combining means.

Jones does teach a transmitting means for transmitting encrypted and non-encrypted data [see Figure 1, 13, communication channel].

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Nardone et al.'s system to include Jones' teaching of a transmitting means. One of ordinary skill in the art would have been motivated to modify Nardone et al.'s as above for the purpose of allowing the data to be sent to authorized users over insecure communication channels.

Referring to claims 2 - 4 and 6, Nardone et al. as modified teach a data processing apparatus according to claim 1, wherein [see column 2, lines 46-48]:

- the data is print data, and the extracting means extracts a print control code from the print data as the particular portion.
- the data is image data whose one pixel has a plurality of bits, and the extracting means extracts predetermined upper bits of each pixel from the image data as the particular portion.
- the data is voice data encoded into codes each having a plurality of bits, and the extracting means extracts predetermined discrete bits of each code from the encoded voice data as the particular portion.
- the data is data compressed by using a conversion table, and extracting means extracts the conversion table from the compressed data as the particular portion.

Nardone et al. teach a selective encryption using video data, which is in digital format. Image data, voice data, compressed data, and print data, once read into a computer, are also in digital format.

Referring to claim 5, Nardone et al. as modified teach a data processing apparatus according to claim 4, wherein the extracting means extracts bits at a predetermined interval of bits from each code [see Figure 4].

Referring to claim 7, Nardone et al. teach a data processing apparatus according to claim 1, further comprising transmission buffer means, wherein said combining means combines the particular portion encrypted by the encrypting means with the

remaining portion not extracted by extracting means, in the transmission buffer means [figure 8, Selector 12", {CVD+} 18].

Referring to claim 8, Nardone et al. teach a data processing apparatus comprising:

- extracting means for extracting an encrypted portion from the data received by the receiving means [column 4, lines 49-51];
- decrypting means for decrypting the encrypted portion extracted by the extracting means [see Figure 5, Encryption Module, 12'];
- combining means for combining the portion decrypted by the decrypting means with a remaining portion not extracted by the extracting means [figure 8]; and
- output means for outputting data combined by the combining means [see Figure 5, {CVD+}, 18].

Nardone et al. do not explicitly teach a decryption side, though they do suggest a decryption side [column 3, lines 60-61].

Jones explicitly shows [see Figure 3] that the process performed on the encryption side (transmitting side) is the reverse process of that performed on the decryption side (receiving side). So with the teachings of Jones in mind, it is obvious to one skilled in the art that though Nardone et al. do not explicitly teach decryption in the above mentioned manner in order for the data to be decrypted a mirror process must occur.

Nardone et al. do not teach a receiving means for receiving data.

Art Unit: 2136

Jones does teach a receiving means for receiving data [see Figure 1, 13, communication channel].

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Nardone et al.'s system to include Jones' teaching of a transmitting means. One of ordinary skill in the art would have been motivated to modify Nardone et al.'s as above for the purpose of allowing the data to be sent to authorized users over insecure communication channels.

Referring to claims 9 -11 and 13, Nardone et al. as modified teach a data processing apparatus according to claim 8, wherein [see column 2, lines 46-48]:

- the data is print data, and the encrypted portion is a print control code.
- the data is image data whose one pixel has a plurality of bits, and the encrypted portion is predetermined upper bits of each pixel of the image data.
- the data is voice data encoded into codes each having a plurality of bits, and the encrypted portion is predetermined discrete bits of each code.
- the data is data compressed by using a conversion table, and the encrypted portion is the conversion table.

Nardone et al. teach a selective encryption using video data, which is in digital format. Image data, voice data, compressed data, and print data, once read into a computer, are also in digital format.

Referring to claim 12, Nardone et al. as modified teach a data processing apparatus according to claim 11, wherein the encrypted portion is bits of each code at a predetermined interval of bits [see Figure 4].

Referring to claim 14, Nardone et al. as modified teach a data processing apparatus according to claim 8, further comprising output buffer means, wherein said combining means combines the particular portion extracted by the extracting means with the remaining portion not extracted by the extracting means in the output buffer means [figure 8, Selector 12", {CVD+} 18].

Referring to claim 15, Nardone et al. teach a data processing method comprising:

- an input step of inputting data to be transmitted [see Figure 5, (CVD+), 16];
- an extracting step of extracting a particular portion of the data input at the input step [column 4, lines 49-51];
- an encrypting step of encrypting the particular portion extracted at the extracting step [see Figure 5, Encryption Module, 12'];
- a combining step of combining the particular portion encrypted at the encrypting step with a remaining portion not extracted at the extracting step [figure 8]; and

Nardone et al. do not teach a transmitting step of transmitting data combined at the combining step.

Jones does teach a transmitting step of transmitting data combined at the combining step [see Figure 1, 13, communication channel].

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Nardone et al.'s system to include Jones' teaching of a transmitting means. One of ordinary skill in the art would have been motivated to modify Nardone et al.'s as above for the purpose of allowing the data to be sent to authorized users over insecure communication channels.

Referring to claim 16, Nardone et al. teach a data processing method comprising:

- an extracting step of extracting an encrypted portion from the data received at the receiving step [column 4, lines 49-51];
- a combining step of combining the portion decrypted at the decrypting step with a remaining portion not extracted at the extracting step [figure 8]; and
- an output step of outputting data combined at the combining step [figure 8].

Nardone et al. do not explicitly teach a decryption side, though they do suggest a decryption side [column 3, lines 60-61].

Jones explicitly shows [see Figure 3] that the process performed on the encryption side (transmitting side) is the reverse process of that performed on the decryption side (receiving side). So with the teachings of Jones in mind, it would have been obvious to one skilled in the art that though Nardone et al. do not explicitly teach decryption in the above mentioned manner in order for the data to be decrypted a mirror process must occur.

Jones does teach a receiving step of receiving data [see Figure 1, 13, communication channel].

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Nardone et al.'s system to include Jones' teaching of a transmitting means. One of ordinary skill in the art would have been motivated to modify Nardone et al.'s as above for the purpose of allowing the data to be sent to authorized users over insecure communication channels.

Referring to claim 17, Nardone et al. teach a data processing program for controlling a computer to perform data processing [see column 4, lines 57-59], said program comprising codes for causing the computer to perform:

- an input step of inputting data to be transmitted [figure 8, (CVD+) 16];
- an extracting step of extracting a particular portion of the data input at the input step [column 4, lines 49-51];
- an encrypting step of encrypting the particular portion extracted at the extracting step [column 4, lines 48-51];
- a combining step of combining the particular portion encrypted at the encrypting step with a remaining portion not extracted at the extracting step [figure 8], {CVD+} 18; and

Nardone et al. also do not teach a transmitting step of transmitting data combined at the combining step.

Jones does teach a transmitting step of transmitting the particular portion encrypted at the encrypting step and a remaining portion not extracted at the extracting step. [see Figure 1, 13, communication channel].

Art Unit: 2136

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Nardone et al.'s system to include Jones' teaching of a transmitting means. One of ordinary skill in the art would have been motivated to modify Nardone et al.'s as above for the purpose of allowing the data to be sent to authorized users over insecure communication channels.

Referring to claim 18, Nardone et al. teach a data processing program for controlling a computer to perform data processing [see column 4, lines 57-59], said program comprising codes for causing the computer to perform:

- an extracting step of extracting an encrypted portion from data received at the receiving step [column 4, lines 49-51];
- a combining step of combining the portion decrypted at the decrypting step with a remaining portion not extracted at the extracting step [figure 8, {CVD+} 18]; and
- an output step of outputting data combined at the combining step [[figure 8, {CVD+} 18].

Nardone et al. do not explicitly teach a decryption side, though they do suggest a decryption side [column 3, lines 60-61].

Jones explicitly shows [see Figure 3] that the process performed on the encryption side (transmitting side) is the reverse process of that performed on the decryption side (receiving side). So with the teachings of Jones in mind, it would have been obvious to one skilled in the art that though Nardone et al. do not explicitly teach

Art Unit: 2136

decryption in the above mentioned manner in order for the data to be decrypted a mirror process must occur.

Nardone et al. do not teach a receiving step of receiving data .

Jones does teach a receiving step of receiving data [see Figure 1, 13, communication channel].

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Nardone et al.'s system to include Jones' teaching of a transmitting means. One of ordinary skill in the art would have been motivated to modify Nardone et al.'s as above for the purpose of allowing the data to be sent to authorized users over insecure communication channels.

Response to Arguments

Applicant amends claims 1, 7,8, and 14-18.

Applicant Argues:

1. Independent claims 1, 15, and 17 are not taught by Nardone et al. or Jones, alone or in combination, to include extracting a particular portion of data, encrypting the particular portion that was extracted, combining the encrypted portion with the remaining portion of data that was not extracted, and transmitting the combined data.
2. Independent claims 8, 16, and 18 are not taught by Nardone et al. or Jones, alone or in combination, to include extracting a portion of data, decrypting the

Art Unit: 2136

extracted portion, combining the decrypted portion with the remaining portion of data that was not extracted, and outputting the combined data.

3. Dependent claims 2-5 and 9-14 are allowable based upon their dependency on allowable claims 1 and 8.

Regarding argument 1., examiner disagrees with applicant. Nardone et al. teach a Selector in figure 8, which "selects" a basic transfer unit for encryption. By selecting the basic transfer unit for encryption the unit is extracted from the remaining data portion that is not extracted/encrypted. The extracted portion is then combined with the remaining portion of the data that is not extracted and output as a partially encrypted compressed video data {CVD+} from the Selector of figure 8. Though Nardone et al. does not explicitly teach transmitting the combined data, though it is suggested by Nardone et al. in column 3, lines 59-61, Jones discloses a transmitting step to transmit the combined data of Nardone et al.

Regarding argument 2., examiner disagrees with applicant. Nardone et al. teach a a Selector in figure 8, which "selects" a basic transfer unit. Though Nardone et al. does not explicitly teach decrypting the extracted portion, though it is suggested by Nardone et al. in column 3, lines 59-61, Jones discloses a decryptor to decrypt the extracted data. The extracted portion is then combined with the remaining portion of the data that is not extracted and output as combined data as taught by Nardone et al.

Art Unit: 2136

Regarding argument 3., examiner disagrees with applicant. Based on the arguments set forth by the examiner for arguments 1. and 2., the dependent claims stand as rejected.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

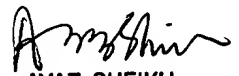

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sara Bowes whose telephone number is 703-305-0326. The examiner can normally be reached on 7:30-4:00, Monday - Friday.

Art Unit: 2136

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz R Sheikh can be reached on 703-305-9648. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
